                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Isold=Q9H252-3; Sequence=VSP 000979, VSP 000980; DOMAIN: The segment S4 is probably the voltage-sensor and is characterized by a series of positively charged amino acids at every third position.

SIMILARITY: Belongs to the potassium channel family. H (Eag)

    subunit assembly.
    -!- SUBUNIT: The potessium channel is probably composed of a homoher content of potessium channel is probably composed of a herotetrameric complex of pore-forming alpha subunits that can associate with modulating beta subunits. Heteromultimers with KCNH-X-KRG1 and KCNH-X-KRG3 (By similarity).
    -!- SUBCELLULAR LOCATION: Integral membrare protein.
    -!- ALTERNATIVE PRODUCTS:

                                                                                                                                                                                                                       DOMAIN: The segment S4 is probably the voltage-sensor and is characterized by a series of positively charged amino acids at every third position.
SIMILARITY: Belongs to the potassium channel family. H (Eag)
                                                                                                                                                                                                                                                                              -1- SIMILARITY: Contains 1 cyclic nucleotide-binding domain.
-!- SIMILARITY: Contains 1 PAS (PER-ARNT-SIM) dimerization domain.
-!- SIMILARITY: Contains 1 PAS-associated C-terminal (PAC) domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          (POTENTIAL)

Fatent No. US2020177201A1
GENERAL INFORMATION:
APPLICANT: Yamanouchi Pharmaceutical Co., Ltd.
TITLE OF INVENTION: A novel potassium channel protein
FILE REFERENCE: Y9903-PCT.
CURRENT APPLICATION NUMBER: US/09/965,830
FURRENT APPLICATION NUMBER: 09/60,776
FRIOR APPLICATION NUMBER: 09/60,776
FRIOR APPLICATION NUMBER: UP P1998-346198
FRIOR APPLICATION NUMBER: JP P1998-346198
FRIOR FILING DATE: 1998-12-04
NUMBER OF SEQ ID NOS: 12
SOFTWARE: PatentIn Ver. 2.0
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             1083

          The invention relates to an antidementia agent that comprises a brain-specific eag-like channel 1 (BEC1) potassium channel inhibitor. Agents of the invention are used as BEC1 potassium channel inhibitors for treating and preventing dementia and learning disabilities. The current sequence represents the BEC1 potassium channel inhibitor amino acid sequence.

The invention discloses a composition comprising two or more isolated rate or human polynucleotides or a polynucleotide which represents a fragment, derivative or allelic variation of the nucleic acid sequence. Also claimed are a vector comprising the novel polynucleotide, a host cell candined are a vector, a method for identifying a nucleotide sequence which is differentially regulated in an animal subjected to pain and a tray, a method for identifying an agent that increases or decreases the expression of the polynucleotide sequence with is differentially expressed in neuronal tissue of a first animal cubjected to pain, a method for identifying a compound which regulates the expression of a polynucleotide sequence which is differentially compound that regulates the activity of one or more of the polynucleotides, a method for producing a pharmaceutical composition, a compound for identifying a compound or small molecule that regulates the composition or small molecule that regulates the composition or small molecule that regulates the specification, a method for identifying a compound useful in treating pain and a pharmaceutical composition comprising the one or more compound that required pain and a pharmaceutical composition comprising the one or more compound that it reating compound is medicament for treating compound settle for preparing a medicament for retaining compound and main and a pharmaceutical composition comprising the one or more of mother antibodies. The polynucleotide or the compound that compound useful for preparing a medicament for comprising the nain compound that compound that in the compound that in the compound that in the compound that the compound 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             injury (CCI) and spared nerve injury (Chung), chronic constriction therapy). The sequence presented is a human protein (shown in Table 2 of the specification) which is differentially expressed during pain. Note: specification, but was obtained in electronic form directly from WIPO at the wipolity but was obtained in electronic form directly from WIPO at the wipolitheby bublished pot_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New composition comprising two or more isolated polypeptides, useful preparing a medicament for treating pain in an animal.

                                                 The present sequence is the human ELK (hELK) polypeptide monomer, comprising an alpha subunit of the voltage-gated potassium channel (VGPCB). It is a member of the Kv (Voltage gated potassium) superfamily, Eag (ether a go-go) family and ELK subfamily of potassium channel monomers. hELK gene is mapped to chromosome 12q13. It is isolated from brain and maintains the resting potential and controls excitability of heuroprotective and anticonvulsant activity. The hELK polypeptide can be used to screen for modulacors of VGPCs, that are useful for treating abnormal ion flux disorders, CNS disorders such as migraines, hearing and vision problems, seizures, psychotic disorders and to prevent strokes. It

Eag (ether a go-go) family and Elk subfamily of potassium channel monomers. hElk gene is mapped to chromosome 1243: It is is abolated from brain and maintains the resting potential and controls excitability of the cell. It has antimigrane, cerebroprotective, antipsychotic, neuroprotective and anticonvulsant activity. The hElk polypeptide can be used to screen for modulators of VGPCs, that are useful for treating abnormal ion flux disorders. Of VGPCs, that are useful for treating and vision problems, seizures, psychotic disorders such as migraines, hearing and vision problems, seizures, psychotic disorders and to prevent strokes. It can be used as a marker for diagnosis of diseases linked to this gene and also as reporter molecule in detection systems. The polynucleotide is useful for gene therapy, to rectify ELK expression. Note: The present sequence is not found in the specification, but is derived from hELK amino acid sequence found in page 62	Inment Scores: 1. t0 Novel polynuclectides and polypeptides of human ELK, a voltage-gated potassium channel subunit useful for treating ELK miss-expression and screen for inhibitors and activators of such channels.

Disclosure; Page; 79pp; English.

The present sequence is the human ELK (hELK) polypeptide variant #2, comprising an alpha subunit of the voltage-gated potassium channel are member of the Kv (Voltage gated potassium, superfamily, CVGPCS). It is a member of the Kv (Voltage gated potassium channel and cher a go-go) family and Elk subfamily of potassium channel can monomers. hElk gene is mapped to chromosome 12q13. It is isolated from monomers hElk gene is mapped to chromosome 12q13. It is isolated from the cell. It has antimigrane, cerebroprotective, antipsychotic, che cell. It has antimigrane, cerebroprotective, antipsychotic, che cell. It has antimigrane, cerebroprotective, antipsychotic, che cell. It has antimigrane, of VGPCS, that are useful for treating condend to screen for modulators of VGPCS, that are useful for treating and vision problems, seizures, psychotic disorders and to prevent strokes. It can be used as a marker for diagnosis of diseases linked to this gene and also as reporter molecule in detection systems. The polymocleotide is useful for gene therapy, to rectify ELK expression. Note: The present sequence is not found in the specification but derived from hELK amino

```

The present sequence is the human ELK (hELK) polypeptide variant #3, comprising an alpha subunit of the voltage-gated potassium channel comprising an alpha subunit of the voltage gated potassium channel agreed potassium channel composed. It is a member of the Kv (Voltage gated potassium channel composed to the case of the case o

The present sequence represents a human potassium channel protein of the ERG family, which is designated Herg4 (human erg related gene 4). The Herg4 polypeptides and polymucleotides are useful in the treatment of epilepsy, migraine, cell proliferation disorders, cancer, comportemental troubles, and to prevent or alter the effect of endogenous neurotransmitters and hormones. Antibodies against Herg4 are also useful for the treatment of carebral, cardiac and renal ischemias, brain and cardiac diseases, inflammation, pain, and to mimic or antagonize the effect of endogenous neurotransmitters and hormones Novel herg4 polypeptide of human erg potassium channel family useful for treatment of epilepsy, migraine, cell proliferation. Claim 11; Page 45-48; 48pp; English Sequence 1083 AA;

This represents a eag similar K+ channel (ESK) polypeptide (hESK1). The hESK1 procein can be expressed by standard recombinant methodology. The ESK polypeptide, polynucleotides and antibodies are useful for treating and diagnosing various potassium channel associated disorders such as neurological disorders. e.g. Altheimer's disease, depression, anxiety, panic, obsessive-compulsive disorders, attention deficit, epilepsy; hyperactivity disorders, autism, exhizophrenia, Huntington's disease and Parkinson's disease, cardiovascular disorders, musculoskeletal disorders and proliferative disorders such as cancer. The ESK polynucleotide is also useful for synthesis of ESK and gene mapping. The polypeptide can be used in an assay to identify molecules such as synthetic drugs, antibodies, peptides or other molecules which have an effect on the activity of the ESK channel
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    249

The present sequence is a ERG-like protein 1 (ERG-LPI) which is a member of ERG potassium channel family. This sequence is from a full length clone likbaz5d10 which was derived from monkey hippocampal library. ERG-LPI is expressed exclusively in the brain. Highest expression is found in functions as a potassium channel modulator and maygdala. The protein antiParkinsonian, anticonvulant, antidepressant, neuropeptective, noctropic activities. The present sequence is useful for treating several potassium channel mediated disorders (CNS disorders) such as Alzheimer's disease, Parkinson's disease, multiple sclerosis, epilepsy, depression, schizophrenic disorders and amnesia
                                                                                                                                                                                                                                                                                                                                                                                                                             Novel gene encoding potassium channel molecule useful in treating central nervous system disorders such as Alzheimer's disease, multiple sclerosis, and schizophrenia.

The invention relates to an isolated human ERG-like protein (ERG-LP2) of the ERG potassium channel family and the nucleic acid encoding it. The ERG-LP2 polypeptide or nucleic acid is useful for modulating potassium channel mediated acid is useful for modulating potassium channel mediated acid is particularly useful for treating potassium channel associated disorders, e.g. neurodegenerative cidentering potassium channel associated disorders, e.g. neurodegenerative disorders (e.g. Alzheimer's disease, Parkinson's disease, multiple solizophrenia, Rorsakoff's psychiatric disorders (e.g. depression, schizophrenia, Korsakoff's psychiatric disorders (e.g. depression, schizophrenia, Korsakoff's psychiatric disorders (e.g. depression, schizophrenia, Rorsakoff's psychiatric disorders (e.g. depression, schizophrenia, Rorsakoff's psychiatric disorders (e.g. amnesia or age-related memory loss), obesity, candiac disorders (e.g. arteriosclerosis, ischaemic reperfusion injury, restenosis, congestive heart failure, angina, hypertension, gastrinal infarction, coronary artery disease or arrhythmia, gromen (e.g. atreesia, hiatal hernia, peptic ulcers, gastriis, stomach tumours, Crohn's disease or ischaemic bowel disease) or pain (e.g. joint pain, tooth pain or headaches). This sequence
New human ERG-like protein (ERG-LP2) potassium channel polypeptide and nucleic acid, useful for treating or diagnosing e.g. Alzheimer's disease, schizophrenia, obesity, restenosis, myocardial infarction, Crohn's
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 CGCTTCGACGGCACGCACAGTAACTTCGTGCTGGGCAACGCCCAGGTGGCGGGGGGGCTCTTC 120

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   100
The present invention relates to novel ERG potassium channel like proteins, designated ERG-LPs, and the polymucleotide sequences encoding theme. Also disclosed are: a host cell containing the polymucleotide, an antibody that selectively binds to the polypeptide, a method for producing the polypeptide, amethod for detecting the presence of the polypeptide or the nucleic acid in a sample, a method for identifying a compound that binds to the polypeptide, a method for adoulating the activity of the polypeptide, amethod for identifying a sequences are useful for producing the ERG-LP polypeptides. The ERG-LP polymucleotide sequences are useful for producing the ERG-LP polymucleotide and polypeptide sequences are useful for preparing a composition for diagnosing or treating diseases e.g. tumours. The present sequence represents monkey ERG-LPI.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           180
